Articulated Fairy Wings – Fashion Doll Accessory

Collaboration with Lolliword

This project was developed in collaboration with artist Lolliword for a fairy-themed Bratz photoshoot. I was responsible for translating the art direction into a fully functional, production-ready wing accessory sculpted in ZBrush.

The design was inspired by Titania's wings from *The Reconciliation of Oberon and Titania*.

The main challenges was reconstructing the unseen side of the wings and determining their internal structure based solely on a single painted reference. The final result balances interpretative design decisions with structural logic to ensure the wings feel both ethereal and physically plausible

The wings were engineered as a segmented articulated system to allow controlled posing while maintaining durability. Pivot placement and range of motion were carefully planned to support expressive photography without stressing the material.

A custom back peg attachment system was designed specifically for this project, ensuring:

- Secure fit
- Easy installation and removal
- Clean integration with the doll body
- Minimal visual interference during shooting

The model was optimized for high-detail resin printing, with attention to wall thickness, part separation, and assembly tolerances. The articulation system was designed with practical production considerations in mind, including mold logic and structural reinforcement points.
